comics

Download, harvest, and aggregate daily comic strips into HTML/PDF.

Requirements

- uv (Python package manager)
- Google Chrome (for PDF generation)
- dosage – `uv tool install dosage`

Usage

```
uv sync
bash get-comics.sh
```

This runs 4 steps:

1. `dosage @` – download today's comics into `Comics/`
2. `harvest.py` – move the newest file from each subdirectory into `todays-input/`, delete old files
3. `aggregate.py` – generate an HTML page with smart layout (wide=full row, tall+square paired)
4. `to-pdf.py` – convert HTML to PDF via headless Chrome

Output goes to `todays-output/`.

Per-script

```
uv run harvest.py      # collect newest from Comics/ -> todays-input/
uv run aggregate.py    # todays-input/ -> todays-output/comics-YYYY-MM-DD.html
uv run to-pdf.py       # HTML -> PDF
```

Layout

Comics are categorized by aspect ratio:

- **Wide** (>1.5:1) – full-width row
- **Square** (0.85-1.5) – side-by-side with tall or other squares
- **Tall** (<0.85) – paired left with a square or another tall

Adapts to whatever mix arrives each day.
